**Re: Quarterly Groundwater Monitoring Report
Hawley Auto Body and Paint
Unauthorized Release File No. H12948-002
2902 Lytton Street
San Diego, CA 92110**

Dear Dr. Sionit:

On behalf of our client, Hawley Auto Body and Paint, D-Max Engineering, Inc. (D-Max) is submitting the attached Quarterly Groundwater Monitoring Report. This work was conducted on March 25 and 26, 2003, in accordance with the County of San Diego's letter dated November 7, 2002 and the submitted workplan dated November 20, 2002.

If you have any questions regarding this report, please do not hesitate to contact me.

Sincerely,
D-Max Engineering, Inc.

Arsalan Dadkhah, Ph.D., P.E.
Project Manager

cc: Mr. Don Hawley, Hawley Auto Body and Paint

SITE DESCRIPTION

The site is located at 2902 Lytton Street, San Diego, California, approximately 200 feet southeast of Rosecrans Street (Figure 1). This site is bounded on the south by Lytton Street and on the west by an AM/PM mini-mart and Loma Carwash. To the east side of the site is a motorcycle shop, and to the north of the site are apartments and single-family residential properties. A review of the 1975 U.S. Geological Survey (USGS) 7.5 Minute Quadrangle, Point Loma, California topographic map indicates that the site lies at an elevation of approximately 40 feet above mean sea level (MSL).

Currently, there are nine groundwater monitoring wells at the site. Based on the workplan submitted on November 20, 2002, these monitoring wells will be sampled on a quarterly basis for a period of one year. The wells have been sampled previously under a separate workplan between February 2000 and February 2002; however, the County requested an additional year of quarterly monitoring. This report presents the results of sampling from the second quarter of this monitoring, which was performed in March 2003.

MONITORING WELL PURGING AND SAMPLING

On March 25 and 26, 2003, a round of sampling was conducted at the site. Wells MW-1 through MW-9 were purged, and groundwater samples were collected and submitted to an analytical laboratory. The purging started with measuring the depth to groundwater at each well. The depth to groundwater ranged from 21.16 feet below ground surface (bgs) at monitoring well MW-9 to 28.66 feet bgs at monitoring well MW-1. Table 1 presents the elevations of the monitoring wells and groundwater elevations that were measured. The results of the groundwater elevation were used to develop a groundwater contour map shown in Figure 2. The groundwater flow direction was calculated to the east with an approximate average gradient of 0.0015 ft/ft.

For each well the borehole's volume was calculated by using the instructions outlined in Section 5 of the 2002 SAM Manual. Having previously determined the recharging characteristic of the wells, the purging process began. An electrical water pump was used to discharge groundwater from the monitoring wells. The discharged groundwater was poured into 55-gallon drums on-site to be disposed of at a later time.

Groundwater removal from each well took place in different steps. At first, one borehole volume of water was removed, and its pH, temperature, electrical conductance, and depth of water were measured. At the second attempt, one-half borehole volume of water was removed, and a similar field water quality measurement was conducted. If the measured change of pH and conductivity was greater than 10 percent of previous readings, the process was repeated for an additional one-half borehole volume of water. The process was repeated until the measured change of pH and conductivity were less than 10 percent of the previous measurements. The field data sheets that were used to record this process are included in Appendix A.

Groundwater samples were collected when the water table recovered 80 percent. Samples were collected with disposable bailers then transferred into 40 ml glass containers and an amber bottle, labeled, stored in an icebox, and submitted to EnviroMatrix Analytical Laboratory within the recommended holding times.

GROUNDWATER SAMPLE ANALYSIS

Nine sets of groundwater samples (one set for each monitoring well) were collected. No free product was observed at any of the monitoring wells. Samples were analyzed for total petroleum hydrocarbons (TPH) at full carbon range in general accordance with Modified EPA Method 8015, as well as for benzene, toluene, ethylbenzene, and total xylene (BTEX), T-butyl alcohol (TBA), Di-isopropyl ether (DIPE), ethyl T-butyl ether (ETBE), T-amyl methyl ether (TAME) and methyl T-butyl ether (MTBE) in general accordance with EPA Method 8260B. The results of the analyses are presented in Table 2. The laboratory reports are included in Appendix B. A summary of all existing and previous groundwater analyses conducted for monitoring wells MW-1 through MW-9 are presented in Table 3.

TABLE 1
MONITORING WELLS AND GROUNDWATER ELEVATIONS
MARCH 2003

Well Location	Top of Casing Elevation¹ (ft)	Depth to Groundwater (ft)	Groundwater Elevation (ft)
MW-1	100.00	28.66	71.34
MW-2	97.50	26.24	71.26
MW-3	97.15	25.85	71.30
MW-4	94.08	22.88	71.20
MW-5	97.46	26.24	71.22
MW-6	97.02	25.78	71.24
MW-7	98.65	27.32	71.33
MW-8	97.25	25.93	71.32
MW-9	92.22	21.16	71.06

Notes:

¹ Based on an arbitrary datum of 100 feet at the top of monitoring well MW-1
